```
produce 2 different mRNAs, one encoding a long form (bcl-XL), the other a short form (bcl-XS), lacking a stretch of 63 amino acids, by differential splicing of the 2nd coding exon to a more proximal 5'-splice donor within the 1st coding exon. Bcl-XS acts as a dominant negative regulator to bcl-XL activity, so it is preferable to use the bcl-XL cDNA for expression. The gene may be modified to facilitate interaction with costimulatory Bax protein and inhibit interaction with antagonistic Bad protein, by modification of the Bcl-2 homology domains BHI and/or BH2. The bcl-XL gene may be introduced into T-cells in vivo or ex vivo via gene transfer using a vector for HIV infection gene therapy, to augment intracellular bcl-XL protein levels and protect from cell death. A corresponding antisense oligonucleotide or expression vector may be used in gene
                                                                                                                                                                                                                                                                                                                                                                                                                 therapy of e.g. autoimmune disease, graft rejection or graft-
versus-host disease, to induce cell death (e.g. apoptosis) and
down-regulate the immune response in a T-lymphocyte population.

Whisperson through describes an apoptosis-resistant virus-sensitive cell Example 2; Page 41-45; 51pp; English.

Example 2; Page 41-45; 51pp; English.

The present invention describes an apoptosis-resistant virus-sensitive cell line into which an apoptosis resistance gene has been introduced.

The recombinant viruses generated are capable of expressing apoptosis-sociated genes. These can then be used in a variety of diseases for which the induction of apoptosis, is therapeutic. The recombinant viruses inhibition of harmful apoptosis, is therapeutic. The recombinant viruses are useful as vectors for gene therapy which can be applied to cancer therapy for destroying cancer cells selectively, the treatment of autoimmune diseases and graft rejection reaction, and apoptosis induction therapy for inflammatory cells in inflammatory diseases. Prior arts have encountered the problem where if an adenovirus vector capable of expressing an apoptosis-associated gene is introduced into animal cells, time required to induce cell death by apoptosis is shorter than that required to replicate and produce the virus, resulting in failure to obtain a recombinant virus having the integrated apoptosis-associated gene. In this invention an apoptosis-resistant gene introduced) is established and overcomes the problem. The present sequence represents the human Bcl-xl gene, and spoptosis resistant gene introduced) is established and overcomes the problem. The present sequence represents the human Bcl-xl gene, and is used in an example from the present invention.

This DNA may be expressed recombinantly for the production of a BCL-X protein, particularly with pcwV plasmids as vectors for expression in mammalian cell cultures. The protein has particular application in cancer cells (failure of programed cell death (PCD))

New isolated human genes and the secreted polypeptide(s) they encode new insolated human genes and treatment of e.g. cencers, neurological useful for diagnosis and treatment of e.g. cencers, neurological disorders, immune diseases, inflammation or blood disorders a classification or blood disorders disorders a nucleic acid molecule designated Gene 120 from This sequence represents a nucleic acid molecule designated Gene 120 from the human cDNA clone HGBG264 (deposited as clone ATCC 97902 and ATCC 20904B) which encodes a secreted human protein. The gene can be used to generate fusion proteins by linking to the gene to a human immunoglobulin compared to the human protein only.

The invention relates to 186 novel genes and their fragments (nucleic acid sequences: V95811-V59812; anino acid sequences W74711-W75026) which are useful for preventing, treating or ameliorating medical conditions can be compared by determining the amount of the new polypeptides in a sample combinance of mutations in the new polynuclectides. Specific uses are described for each of the 186 polynuclectides, based on
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 (HUMA) HUMAN GENOME SCI INC.

An animal model exhibiting reduced levels of a Bcl-w protein and/or protein associated with Bcl-w

Disclosure; Page 38; 52pp; English.

The present sequence is described as a derivative of the mouse close x25133 and encodes Bcl-w protein (see Y05533), a core-wivival member of the Bcl-2 family which is widely expressed and which is essential for spermatogenesis. The invention relates cand which is essential for spermatogenesis. The invention relates candentification of molecules and genetic sequences useful for the inducting or reducing fertility of male animals. Methods are provided for the treatment of infertility, or for reducing ertility, by modulating spermatogenesis. An animal model carries a mutation is at least one allele of the human or murine bcl-w gene car mutation is at least one allele of the human or murine bcl-w gene core in a gene associated with bcl-w. Such animals have disorganised conter major abnormalities as determined by histological examination. They can be used to screen for therapeutic molecules including entities and are substantially infertile, but possess no cher major abnormalities and inducing, enhancing or otherwise facilitating spermatogenesis in animals, or which can induce
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ccyctycaccaayccatycyyycayctyyaatyayttcyayacccycttccyycacc 180

Claim 2; Fig 12A-12D; 12Opp; English.

This is the nucleotide sequence of the cDNA clone Bcl-like (HAICH29), used in the method of the invention. The products of the clone can be used for treating conditions associated with abnormal expression of the polypeptides. They can be used for e.g. treating chronic inflammatory diseases, immunological disorders, autoimmune diseases, inflammatory diseases, various allergies, and as anti-infectious agents. The products can also be used for detection and diagnosis. Sequence 1098 BP; 264 A; 279 C; 325 G; 230 T;
                                                                      20-NOV-1998 (first entry)
Nucleotide sequence of the cDNA clone Bcl-like (HAICH29).

Claim 3; Page 50-51; 86pp; English.
This sequence encodes a novel gene, bcl-w, from the mouse bcl-2 gene this sequence encodes a novel gene, bcl-w, from the moulation is useful in treatment of cancer or auto-immune diseases, degenerative diseases (e.g. stroke, Alzheimer's disease, myocardial infarct, muscular degeneration, hypoxia, ischaemia, human immunodeficiency virus infection or in cell transplants. Up-regulation of the gene can also be used to modify cell lines cultured in vivo, e.g. to develop new lines, to facilitate isolation of hybridomas and to increase survival of primary explants during genetic modification. It can be used to produce recombinant Bcl-w for therapy, diagnosis, antibody production or screening of potential modulators.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ttctctgatctggcggctcagctgcatgtgaccccaggctcagcccagcaacgcttcacc 240

```
for modulating programmed cell death

Disclosure: Columns 13-16; 26pp; English.

The present sequence encodes rat bcl-y protein (Rbcl-y). The present sequence encodes rat bcl-y protein (Rbcl-y). Rbcl-y and pecification also describes human bcl-y protein (Rbcl-y). Rbcl-y and pecification also describes human bcl-y protein (Hbcl-y). Rbcl-y and Bbcl-y are homologues of the bcl-2 protein thought to be involved in programmed cell death (apoptosis and necrosis). Rbcl-y and Hbcl-y and pbcl-y proteins may be used to treat conditions associated with a disruption of the cell death pathway. If they act as cell death inhibitors, they may be used to treat subjects suffering from: strokes, head trauma, the cell death pathway. If they act as cell death inhibitors, they may be used to treat subjects suffering from: strokes, head trauma, alzehmer's Disease, neural and muscular degenerative diseases.

Caspecially multiple sclerosis), mycocadial infarction, vitally induced cell death, aging, spinal cord injuries and amyotrophic lateral cell death, aging, spinal cord injuries and amyotrophic lateral cell death, aging, spinal cord injuries and amyotrophic lateral cell neath as a result of triggers which may or may not be apparent. They may also be used in this way to develop cell lines which remain viable in culture for an extended period. In contrast, if they act as cell death stimulators, Rbcl-y and Hbcl-y may be used to treat conditions associated with prolonged cell life span such as cancer (especially kaposi's sarcoma and lung cancer) and auto/hyperimmune diseases. They may also be used to cause cell death in, and hence control, parasites.

An animal model exhibiting reduced levels of a Bcl-w protein and/or protein associated with Bcl-w

Scalaim 3: Page 3: 52pp: English.

The present sequence is the mouse bcl-w gene encoding Bcl-w protein (see Y0531), a pro-survival member of the Bcl-2 family which is widely expressed and which is essential for spermatogenesis. The invention relates generally to a method of treatment and to an animal model for the identification of molecules and genetic invention relates provided for the treatment of infertility, or canimals. Methods are provided for the treatment of infertility, or for reducing fertility, by modulating spermatogenesis. An animal model carries a mutation is at least one allele of the human or more increased in a gene or in a gene associated with bol-w. Such animals have disorganised seminferous tubules and are substantially infertile, but possess no other major abnormalities as determined the infertile, but possess no other major abnormalities as determined therapeutic molecules including genetic sequences capable of inducting, enhancing or otherwise facilitating spermatogenesis in animals, or which can induce infertility.
                                                                                                                                                                                                                                                         Gibson L, Koentgen F, Print C;

The mammalian bcl.y genes froode a protein that is a member of the bcl-2 family components in the cell death pathway. The bcl-2 family have both apoptoric activity and the apoptosis blocking activity. bcl-y falls in the apoptosis activity category. The recombinant protein may be used to prevent uncontrolled cell growth, either by its direct administration to recombinant genetic constructs to increase its expression in vivo. Also, antisense constructs can be used in disorders where prevention of cell death is desired.

An animal model carries a mutation is at least one allele of the human or murine bcl.w gene or in a gene associated with bcl.w. Such animals have disorganised seminferous tubules and are substantially infertile, but possess no other major abnormalities as determined by histological examination. They can be used to screen for therapeutic molecules including
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 protein associated will but a solution of the human bisclosure; Page 38; 52pp; English.

The present sequence is described as a derivative of the human bcl-w gene (see X25132) and encodes Bcl-w protein (see Y05532), a pro-survival member of the Bcl-2 family which is widely expressed and which is essential for sperimatogenesis. The invention relates generally to a method of treatment and to an animal model for the identification of molecules and generic sequences useful for inducing or reducing fertility of male animals. Methods are provided for the treatment of infertility, or for reducing provided for the treatment of infertility, or for reducing fertility and inducing or the treatment of infertility.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         An animal model exhibiting reduced levels of a Bcl-w protein and/or protein associated with Bcl-w

Problem 10031 (10033).

An animal model exhibiting reduced levels of a Bcl-w protein and/or protein associated with Bcl-w

Sclaim 3; Page 31; 52pp; English.

Claim 3; Page 31; 52pp; English.

The present sequence is the human bcl-w gene encoding Bcl-w protein (see Y0530), a pro-survival member of the Bcl-2 family which is undely expressed and which is essential for spermatogenesis. The invention relates generally to a method of treatment and to an animal model for the identification of molecules and genetic sequences useful for inducing or reducing fertility of male sequences useful for inducing or reducing fertility, or for reducing fertility, by modulating spermatogenesis. An animal model carries a mutation is at least one allele of the human or murine bcl-w gene or in a gene associated with bcl-w. Such animals the at least one allele of the human or infertile, but possess no other major abnormalities as determined by histological examination. They can be used to screen for therapeutic molecules including genetic sequences capable of 480 481 ogtctgogggagggaactgggcatcagtgaggacagtgctgacgggggccgtggcactg 540 540 301 ctctttggggctgcactgtgtgctgagagtgtcaacaaggagatggaaccactggtggga 360 421 AGTGGGGGCTGGGCGGAGTTCACAGCTCTATACGGGGACGGGGCCCTGGAGGAGGAGCGCGGG 480 181 ttctctgatctggcggctcagctgcatgtgaccccaggctcagcccagcaacgcttcacc 240 121 ccgctgcaccaagccatgcgggcagctggagatgagttcgagacccgcttccggcgcacc 180 121 ccecrecaccarecarecaecaecrecaecresaerresaerresaeaccescrrccaececaec 180 181 ITCTCTGATCTGGCGGCTCAGCTGCATGTGACCCCAGGCTCAGCCCAGCAACGCTTCACC 240 241 caggictccgacgaactititcaagggggccccaaciggggccgcctigtagccitctit 300 1 ATGGCGACCCCAGCCTCGGCCCCAGACACACGGGCTCTGGTGGCAGACTTTGTAGGTTAT 60 Spermatogenesis; bcl-3 gene; Bcl-2; human; fertility; infertility; 421 agtgggggctgggcggagttcacagctctatacggggacggggccctggaggaggcgcgg 481 CGTCTGCGGGAGGGGAACTGGGCATCAGTGAGGACAGTGCTGACGGGGGCCGTGGCACTG 541 ggggccctggtaactgtaggggccttttttgctagcaagtgaa 583 25-MAR-1999.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                          1 atggcgaccccagcctcggc...........

```
cc dominant negative regulator to bcl-XL activity, so it is preferable to use the bcl-XL cDNA for expression. The gene may be modified to facilitate interaction with costimulatory Bax protein and inhibit interaction with antagonistic Bad protein, by modification of the Bcl-2 homology domains BH1 and/or BH2. The bcl-XL gene may be introduced into T-cells in vivo or ex vivo via gene transfer using a vector for HIV infection gene therapy, to augment intracellular cbcl-XL protein levels and protect from cell death. A corresponding antisense oligonucleotide or expression vector may be used in gene chrange of antisense oligonucleotide or expression vector may be used in gene continuate disease, to induce cell death (e.g. apoptosis) and coverus-host disease, to induce cell death (e.g. apoptosis) and coverus-host disease, to induce cell death (e.g. apoptosis) and sequence 926 BP; 220 A; 249 C; 264 G; 193 T;

which the induction of apoptosis by gene transfer, or where the inhibition of harmful apoptosis, is therapeutic. The recombinant viruses are useful as vectors for gene therapy which can be applied to cancer therapy for destroying cancer cells selectively, the treatment of autoimmune diseases and graft rejection reaction, and apoptosis induction therapy for inflammatory deliamatory diseases. Prior arts have concountered the problem where if an adenovirus vector capable of expressing an apoptosis-associated gene is introduced into animal cells, the cells producing the virus will be destroyed because the period of time required to reduce cell death by apoptosis is shorter than that required to replicate and produce the virus, resulting in failure to obtain a recombinant virus having the integrated apoptosis-associated contains apoptosis-resistant 293 cell line (having an apoptosis resistant gene introduced) is established and overcomes the problem. The present sequence represents the base sequence of the problem. The present sequence represents the human Bcl-xl gene, and is used in an example from the present invention.

This DNA may be expressed recombinantly for the production of a BCL-X protein, particularly with pcw V plasmids as vectors for expression in mammalian cell cultures. The protein has particular application in cancer cells (failure of programed cell death (PCD))

This sequence encodes human bcl.*XL protein, which protects T-lymphocytes against cell death. The genomic bcl.*X gene may produce 2 different mRNAs, one encoding a long form (bcl.*XL), the other a short form (bcl.*XS), lacking a stretch of 63 amino acids, by differential splicing of the 2nd coding exon to a more proximal 5'-splice donor within the 1st coding exon. Bcl.*XS acts as a

This sequence represents a nucleic acid molecule designated Gene 120 from this sequence represents a nucleic acid molecule designated Gene 120 from the human cDNA clone HGBGZ64 (deposited as clone ATCC 97902 and ATCC 209048) which encodes a secreted human protein. The gene can be used to generate fusion proteins by linking to the gene to a human immunoglobulin protein as compared to the human protein only.

The invention relates to the human protein only.

The invention relates to 186 movel genes and their fragments (nucleic acid sequences: V59511-V59812; amino acid sequences W74731-W75026) which are useful for preventing, treating or ameliorating medical conditions e.g. by protein or gene therapy. Also, pathological conditions can be diagnosed by determining the amount of the new polypeptides in a sample or by determining the presence of mutations in the new polynucleotides. Specific uses are described for each of the 186 polynucleotides, based on
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New isolated human genes and the secreted polypeptide(s) they encode useful for diagnosis and treatment of e.g. cancers, neurological disorders, immune diseases, inflammation or blood disorders Claim 1; Page 353-354; 721pp; English.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     (HUMA-) HUMAN GENOME SCI INC.

                                                                                                                        Disclosure; Columns 15-16; Zepp, English.

The present sequence encodes human bcl-y protein (Rbcl-y). The specification also describes rat bcl-y protein (Rbcl-y). Rbcl-y and Bcl-y are homologues of the bcl-2 protein thought to be involved in programmed cell death (apoptosis and necrosis). Rbcl-y and Hbcl-y contributions associated with a disruption of the cell death pathway. If they act as cell death inhibitors, they may be used in theraples to treat subjects suffering from: strokes, head trauma, larged in theraples to treat subjects suffering from: strokes, head trauma, larged in theraples to treat subjects suffering from: strokes, head trauma, larged in the cell death, aging, spinal cord injuries and amyotrophic lateral cell death, aging, spinal cord injuries and amyotrophic lateral cell death, aging, spinal cord injuries and amyotrophic lateral cell death as a result of triggers which may or may not be apparent. They may also be used in this way to develop cell lines which remain viable in culture for an extended period. In contrast, if they act as cell death stimulators, con extended period. In contrast, if they act as cell death stimulators, Rbcl-y and Hbcl-y may be used to treat conditions associated with prolonged cell life span such as cancer (especially kaposi's sarcoma and auco/hyperinmune diseases. They may also be used to cancer centered.

ö
have both apoptotic activity and the apoptosis blocking activity. bcl-y falls in the apoptosis activity category. The recombinant protein may be used to prevent uncontrolled cell growth, either by its direct administration to recombinant genetic constructs to increase its expression in vivo. Also, antisense constructs can be used in disorders where prevention of cell death is desired.

Claim 3; Page 48: 86pp; English.

This sequence encodes a novel human gene, bcl-w, from the bcl-2 gene family, extracted from an adult brain library. This gene promotes cell survival, so its modulation is useful in treatment of cancer or auto-immune diseases, degenerative diseases (e.g. stroke, Alzheimer's disease, myozafula infarct, muscular degeneration, hypoxia, ischaemia, human immunodeficiency virus infection or in cell transplants.

Up-regulation of the gene can also be used to modify cell lines cultured in vivo, e.g. to develop new lines, to facilitate isolation of hybridomas and to increase survival of primary explants during genetic modification. It can be used to produce recombinant Bcl-w for therapy, diagnosis,

An animal model exhibiting reduced levels of a Bcl-w protein and/or protein associated with Bcl-w

Disclosure; Page 36; 52pp; English.

Disclosure; Page 36; 52pp; English.

The present sequence is described as a derivative of the human consent sequence is described as a derivative of the human color-survival member of the Bcl-2 family which is widely expressed and which is essential for spermatogenesis. The invention relates generally to a method of treatment and to an animal model for the identification of molecules and genetic sequences useful for inducing or reducing fertility of male animals. Methods are provided for the treatment of infertility, or for reducing fertility of male animals. Methods are provided for the treatment of infertility, an animal model carries a mutation is at least one allele of the human or murine bcl-w gene con in a gene associated with bcl-w. Such animals have disorganised seminferous tubules and are substantially infertile, but possess no other major abnormalities as determined by histological examination.

They can be used to screen for therapeutes including
                                                                                                                                                                                                                                                                                                                                                                                                          540

Novel Dcl.y nomologues of clil death number of process.

for modulating programmed cell death bisclosure; Columns 13-16; 26pp; English.

Disclosure; Columns 13-16; 26pp; English.

The present sequence encodes rat bcl.y protein (Rbcl.y). The sequence encodes rat bcl.y protein (Rbcl.y). Rbcl.y and Bbcl.y are homologues of the bcl.2 protein thought to be involved in Bbcl.y are homologues of the bcl.2 protein thought to be involved in Bbcl.y are homologues of the bcl.2 protein thought to be involved in Bbcl.y and Bb
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             agtggcggctgggcggacttcacagctctatacggggacggggcctggaggacgcacgg 480

Claim 3; Page 32: 52pp; English.

Claim 3; Page 32: 52pp; English.

Claim 3; Page 32: 52pp; English.

The present sequence is the human bcl-w gene encoding Bcl-w protein

The present sequence is the human bcl-w gene encoding Bcl-w protein

The present sequence is the human bcl-w gene encoding Bcl-w protein

The present sequence is sesential for spermatogenesis. The widely expressed and which is essential for secules and genetic

The invention relates generally to a method of treatment and to an invention relates generally to a method of treatment of infertility, or animals. Methods are provided for the treatment of infertility, or animals. Methods are provided for the treatment of infertility, or animals. Methods are provided for the treatment of infertility, or model carries a mutation is at least one allele of the human or model carries a mutation is at least one allele of the human or model carries deminiferous tubules and are substantially infertille, but possess no other major abnormalities as determined by histological examination. They can be used to screen for therapeutic molecules including genetic sequences capable of the canimals, or which can induce infertility.

growth e.g. cancers

Claim 2; Column 13/14; 27pp; English.

The mammalian bcl. y genes encode a protein that is a member of the bcl-2
family, components in the cell death pathway. The bcl-2 family,
have both apoptotic activity and the apoptosis blocking activity, bcl-y
falls in the apoptosis activity category. The recombinant protein may
be used to prevent uncontrolled cell growth, either by its direct
administration to recombinant genetic constructs to increase its
expression in vivo. Also, antisense constructs can be used in disorders
where prevention of cell death is desired.

The present sequence is described as a derivative of the mouse of the present sequence is described as a derivative of the mouse of the present sequence is described as a derivative of the mouse of the pro-survival member of the Bol-2 family which is widely expressed and which is essential for spermatogenesis. The invention relates of generally to a method of treatment and to an animal model for the identification of molecules and genetic sequences useful for inducing or reducing fertility of male animals. Methods are provided for the treatment of infertility, or for reducing fertility, by modulating spermatogenesis. An animal model carries a mutation is at least one allele of the human or murine bcl-w gene cor in a gene associated with bcl-w. Such animals have disorganised seminferous tubules and are substantially infertile, but possess no other major abnormalities as determined by histological examination. They can be used to screen for therapeutic molecules including

The invention relates generally to a method of treatment and to an animal model for the identification of molecules and genetic sequences useful for inducing or reducing fertility of male animals. Methods are provided for the treatment of infertility, or for reducing fertility, by modulating spermatogenesis. An animal model carries a mutation is at least one allele of the human or murine bcl-w gene or in a gene associated with bcl-w. Such animals
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              An animal model exhibiting reduced levels of a Bcl-w protein and/or protein associated with Bcl-w Claim 3; Page 34; 52pp; English.

Nucleic acid encoding apoptosis related gene bcl-w - used to induce provided acid encoding apoptosis related gene bcl-w - used to induce or inhibit cell survival, e.g. for treatment of cancer and degenerative diseases.

Claim 3: Page 50-51; 86pp; English.

This sequence encodes a novel gene, bcl-w, from the mouse bcl-2 gene can mily. This gene promotes cell survival, so its modulation is useful in treatment of cancer or auto-immune diseases, degenerative diseases (e.g. stroke, Alzheimer's disease, myocardial infarct, muscular degeneration, bypoxia, ischaemia, human immunodeficiency virus infection or in cell transplants. Up-regulation of the gene can also be used to modify cell ines cultured in vivo, e.g. to develop new lines, to facilitate isolation of hybridomas and to increase survival of primary explants during genetic modification. It can be used to produce recombinant Bcl-w for therapy, diagnosis, antibody production or screening of potential
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps

This protein may be expressed recombinantly, particularly with porphasmids as vectors for expression in mammalian cell cultures. The protein has particular application in cancer cells (failure of programmed cell death (PCD)) or neurodegenerative and autoimmune diseases (premature PCD), e.g. Parkinson's disease, amylotrophic literature of the programmed cell death (PCD) and protein has particular application in cancer cells (failure of programmed cell death (PCD), e.g. Parkinson's disease, amylotrophic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                02-MAY-1996;
04-MAY-1995;
07-JUN-1995;
T-lymphocytes against cell death. A splice variant form, bol-xs, lacks a stretch of 63 amino acids, and is a dominant negative regulator of bcl-XL function. The gene may be modified to facilitate interaction with costimulatory Bax protein and inhibit interaction with antagonistic Bad protein, by modification of the Bcl-2 homology domains BH1 and/or BH2. The bcl-XL gene may be ector for HIV infection gene therapy, to augment intracellular a vector for HIV infection gene therapy, to augment intracellular bcl-XL protein levels and protect from cell death. A corresponding antisense oligonucleotide or expression vector may be used in gene therapy of e.g. autoimmune disease, graft rejection or graftversus-host disease, to induce cell death (e.g. apoptosis) and
                                                                                                                                                                                                                                                   Inducing or preventing death of T cells by bcl-XL protein regulation used to increase survival of HIV infected cells or to down:regulate immune responses in immune diseases Disclosure; Page 52-53; 76pp; English.

This is the sequence of a human bcl-XL protein, which protects
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     N-PSDB; Q81698.

This sequence represents a novel protein, bcl-w, encoded by the mouse bcl-2 gene family. This gene promotes cell survival, so its modulation is useful in treatment of cancer or auto-immune diseases, degenerative diseases (e.g. stroke, Alzheimer's disease, myocardial infarct, muscular degeneration, hypoxia, ischaemia, human immunodeficiency virus infection or in cell transplants. Up-regulation of the gene can also be used to modify cell lines cultured in vivo, e.g. to develop new lines, to explants abundanted in phytidomas and to increases survival of primary explants during genetic modification. It can be used to produce recombinant Bcl-w for therapy, diagnosis, antibody production or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö

              substantially infertile, but possess no other major abnormalities as determined by histological examination. They can be used to screen for therapeutic molecules including genetic sequences capable of inducing, enhancing or otherwise facilitating spermatogenesis in animals, or which can induce infertility.

```
for modulating programmed cell death

Claim 2: Columns 19-22: 26pp; English.

The present sequence represents a mammalian bcy-1 protein.

The present sequence represents a mammalian bcy-1 protein.

The present sequence represents a mammalian bcy-1 protein.

The specification describes rat bcl-y protein (Rbcl-y) and human bcl-y

protein (Hbcl-y). Rbcl-y and Hbcl-y are homologues of the bcl-2 protein

thought to be involved in programmed cell death (apoptosis and necrosis).

Rbcl-y and Hbcl-y proteins may be used to treat conditions associated

with a disruption of the cell death pathway. If they act as cell death

thought to be used in themspies to treat subjects suffering

from: strokes, head trauma, Alzheimer's Disease, neural and muscular

degenerative diseases (especially multiple sclerosis), myocardial

infarction, vitally induced cell death, ading, spinal cord injuries and

amyotrophic lateral sclerosis- conditions where cells under go premature

cell death as a result of triggers which may or may not be apparent.

They may also be used on extended period. In contrast, if they act as

cell death stimulators, Rbcl-y and Hbcl-y may be used to treat

conditions associated with prolonged cell life span such as cancer

conditions associated with prolonged cell life span such as cancer

conditions associated with prolonged cell life span such as cancer

conditions associated with prolonged cell life span such as cancer

conditions associated with prolonged cell life span such as cancer

conditions associated with prolonged cell life span such as cancer

conditions associated with prolonged cell life span such as cancer

conditions associated of the prolonged cell life span such as cancer

conditions associated of the prolonged cell life span such as cancer

conditions associated of the prolonged cell life span such as cancer

conditions as cancer and cell place and cell life span and cell shall man and contract as cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           20.MAY-1999 (first entry)

for modulating programmed cell death

Disclosure; Columns 19-20; 26pp; English.

The specification describes rat bcl-y protein (Rbcl-y) and human bcl-y
protein (Hbcl-y). Rbcl-y and Hbcl-y proteins of the bcl-2 protein

thought to be involved in programmed cell death (apoptosis and necrosis).

CR Rbcl-y and Hbcl-y proteins may be used to treat conditions associated
with a disruption of the cell death pathway. If they associated
with a disruption of the cell death pathway. If they associated
with a disruption of the cell death pathway. If they act as cell death
inhibitors, they may be used in therapies to treat subjects suffering
from: strokes, head trauma, Alzheimer's Disease, neural and muscular
degenerative diseases (especially multiple sclerosis), myocardial
infarction, vitally induced cell death, aging, spinal cord injuries and
amyotrophic lateral sclerosis- conditions where cells under go premature
cell death as a result of triggers which may or may not be apparent.
They may also be used in this way to develop cell lines which remain
viable in culture for an extended period. In contrast, if they act as
coll death stimulators, Rbcl-y and Hbcl-y may be used to treat
(especially kaposi's sarcoma and lung canneer) and auto/hyperimmune
conditions associated with prolonged cell life span such as cancer
diseases. They may also be used to cause cell death in, and hence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 protein associated with Bcl.w

Disclosure; Page 39; 52pp; English.

The present sequence is described of a derivative of mouse Bcl-w
(see also 905531), a pro-survival member of the Bcl-2 family that
is widely expressed and which is essential for spermatogenesis.

The derivative lacks the 24 N-terminal amino acids of Bcl-w.

The invention relates generally to a method of treatment and to an
animal model for the identification of molecules and genetic
sequences useful for inducing or reducing fertility of male animals.

Methods are provided for the treatment of infertility, or for
Rethods are provided for the treatment of infertility, or for
reducing fertility, by modulating spermatogenesis. An animal model
carries a mutation is at least one allele of the human or murine
bcl-w gene (see X25132-35) or in a gene associated with bcl-w.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   121 VQDWMVTYLETRLADWIHSSGGWAEFTALYGDGALEEARRLREGNWASVRTVLTGAVALG 180

The present sequence represents rat bcl-y protein (Rbcl-y). The specification also describes human bcl-y protein (Hbcl-y). Rbcl-y and bcl-y are homologues of the bcl-2 protein thought to be involved in programmed cell death (apoptosis and necrosis). Rbcl-y and Hbcl-y corpresents are conditions associated with a disruption of programmed cell death pathway. If they act as cell death inhibitors, they may be used in therapies to treat subjects suffering from: strokes, head trauma, and in therapies to treat subjects suffering from: strokes, head trauma, cell death, aging, spinal cond injuries and amyotrophic lateral cell death, aging, spinal cord injuries and amyotrophic lateral cell death, aging, spinal cord injuries and amyotrophic lateral solerosis conditions where cells under go premature cell death as a cell death as to extended period. In contrast, if they act as cell death stimulators, an extended period. In contrast, if they act as cell death stimulators, colonged cell life span such as cancer (especially kaposi's sarcoma and control, parasites.
                                                                                                                                                                                                   The rat bc1-y protein.

The rat bc1-y protein.

The boll-2 family have both apoptotic activity and the apoptosis blocking activity. bolly falls in the apoptosis activity category. The recombinant protein may be used to prevent uncontrolled cell growth, either by its direct administration to recombinant genetic constructs to increase its expression in vivo. Also, antisense constructs can be used in disorders where prevention of cell

growth e.g. cancers

Example. Column 17/18: 27pp; English.

The mammalian bcl.y protein is a member of the bcl.2 family, components in the cell death pathway. The bcl.2 family have both apoptotic activity and the apoptosis blocking activity. bcl.y falls in the apoptosis activity activity activity activity activity ategory. The recombinant protein may be used to prevent uncontrolled cell growth, either by its direct administration to antisense constructs to increase its expression in vivo. Also, antisense constructs can be used in disorders where prevention of cell death is desired.
                                                                                                                                                                                                                                                                                              ó

                 fertility of male animals. Wethods are provided for the treatment of infertility, or for reducing fertility, by modulating spermatogenesis. An animal model carries a mutation is at least one allele of the human or murine bcl-w gene (see X25132-35) or in a gene associated with bcl-w. Such animals have disorganised seem inferous tubules and are substantially infertile, but possess no other major abnormalities as determined by histological examination. They can be used to screen for therapentic molecules including qenetic sequences capable of inducing, enhancing or otherwise facilitating spermatogenesis in animals, or which can induce

The property of the part and numan bol-2 protein - useful.

The modulating programmed cell death

Cor modulating based but a bol-3 protein (Rbol-y). The

Specification also describes rat bol-y protein (Rbol-y). Rbol-y and

Bbol-y are homologues of the bol-2 protein thought to be involved in

Corporammed cell death (apoptosis and necrosis). Rbol-y and Hbol-y

Corporammed cell death pathway. If they act as cell death inhibitors, they may be

Corporating may be used to treat conditions associated with a disruption of

Corporation also treat the pathway of they act as cell death inhibitors, they may be

Coursed in therapies to treat subjects suffering from: strokes, head trauma,

Alzheimer's Disease, neural and muscular degenerative diseases

Coll death, aging, spinal cord injuries and amyotrophic lateral

sclerosis-conditions where cells under go premature cell death as a

cell death, aging, spinal cord injuries and amyotrophic lateral

sclerosis-conditions where cells under go premature cell death as a

cell death, aging spinal cord injuries and myotrophic lateral

sclerosis-conditions where cells in they act as cell death stimulators,

Coused in this way to develop cell life where conditions associated with

Rbol-y and Hbol-y may be used to treat conditions associated with

Couse cell death sim, and hence control, parasites.
                                                                                                                                                                                                                                                                                                                                                              The human bolyprotein.

The human bolyprotein.

Rat boly protein, Rboly, human bolyprotein; Hboly; boll-2 homologue; programmed cell death; apoptosis; necrosis; cell death inhibitor; stroke; head trauma; Alzheimer's Disease; neural; muscular degenerative disease; multiple solerosis; myocardial infarction; vitally induced cell death; aging; spinal cord injury; amyotrophic lateral sclerosis; cancer; premarure cell death; cell death stimulator; prolonged cell life span; Kaposi's sarcoma; lung cancer; autoimmune; hyperimmune disease;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö

claim 6; page 48 86pp; English.
This sequence represents a novel human protein, bcl-w, encoded by the bcl-2 gene family and extracted from an adult brain library. This gene promotes cell survival, so its modilation is useful in treatment of cancer or auto-immune diseases, degenerative diseases (e.g. stroke, alzhehmer's disease, myocardial infarct, muscular degeneration, hypoxia, ischaemia, human immunodeficiency virus infection or in cell transplants. Up-regulation of the gene can also be used to modify cell lines cultured in vivo, e.g. to develop new lines, to facilitate isolation of hybridomas and to increase survival of primary explants during genetic modification. It can be used to produce recombinant Bcl-w for therapy, diagnosis, antibody production or screening of potential modulators.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             61 FSDLAAQLHVTPGSAQQRFTQVSDELFQGGPNWGRLVAFFLFGAALCAESVNKEMEPLVG 120

The present sequence is human BCl-w, a pro-survival member of the Bcl-2 family which is widely expressed and which is essential for spermatogenesis. The invention relates generally to a method of treatment and to an animal model for the identification of molecules and genetic sequences useful for inducing or reducing a fertility of male animals. Methods are provided for the treatment.

Spermatogenesis. An animal model carries a mutation is at least of infertility, or for reducing fertility, by modulating spermatogenesis. An animal model carries a mutation is at least of a sensociated with bcl-w. Such animals have disorganised seminferous tubules and are substantially infertile, but possess no cher major abnormalities as determined by histological examination. They can be used to screen for therapeutic molecules including genetic sequences capable of inducing, enhancing or otherwise infinity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              61 FSDLAAQLHVIPGSAQQRFTQVSDELFQGGPNWGRLVAFFLFGAALCAESVNKEMEPLVG 120

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        protein associated with Bcl-w
Claim 2; Page 35; 52pp; English.
The present sequence is mouse Bcl-w, a pro-survival member of the
Bcl-2 family which is widely expressed and which is essential for
spermatogenesis. The invention relates generally to a method of
treatment and to an animal model for the identification of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        05-JUL-1999 (first entry)
Mouse Bcl-w protein essential for spermatogenesis.
Spermatogenesis; Bcl-3; Bcl-2; mouse; fertility; infertility;
